

It's too cold here for heartworms.

Grounded or **Unfounded?**

FACT: Even in regions where cold weather prevails, such as US states in the far north, pets have been diagnosed with heartworms.

Mosquito species change and adapt to

frigid climates, and some species successfully overwinter.

BEST STRATEGY: A routine 12-month prevention program regardless of predominantly cold weather.

Protection is priceless.

Choose year-round heartworm prevention for your pet.
